COSC 219 — M1 Game Explorer Proposal

Tanatswa Mashumba | Kudakwashe Kelvin Sibanda

Project Description

Game Explorer is an interactive website that helps users discover video games and identify which devices they are available on, including PC, PlayStation, Xbox, Nintendo, Android, and iPhone (iOS). Users can search for games, filter by platform or genre, view details such as release dates, and save their favourite games for future visits.

Intended Audience

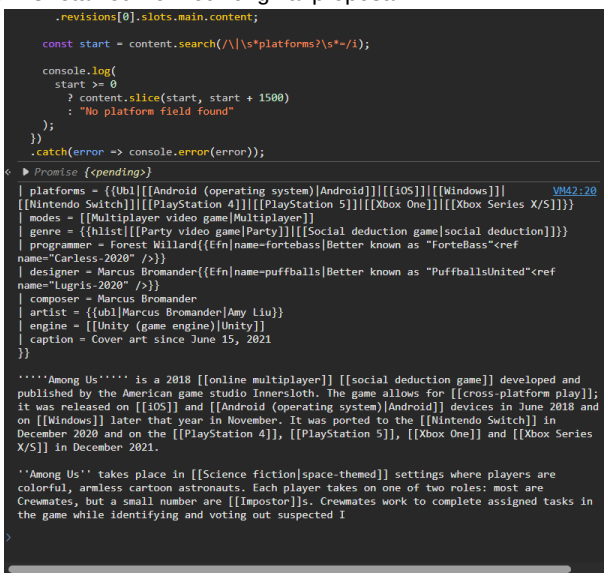

Game Explorer is designed for gamers of all ages who play on PC, PlayStation, Xbox, Nintendo, Android, or iPhone. It helps users discover new games and identify which devices support them.

Public API

Wikipedia (MediaWiki Action API) — https://www.mediawiki.org/wiki/API:Main_page. We plan to use JavaScript fetch() to retrieve game information, including titles, supported platforms, genres, and release information.

API Test Evidence

The original browser test captured Wikipedia information for Among Us, including Android, iOS, Windows, PlayStation, Xbox, and Nintendo Switch. The screenshot below is retained from our original proposal.

Interface Sketch

Search bar and Search button; platform and genre filters; game cards showing game details and a Save Favourite action; My Favourites section. The original proposal includes a hand-drawn-style layout sketch.

Hardest Requirement

Handling loading, empty, loaded, and error states for live Wikipedia data. We must show clear messages while data loads, when no results are found, and when a request fails.

Division of Work

Kudakwashe Kelvin Sibanda: Game search, Wikipedia API fetch(), displaying game information, and platform filters. **Tanatswa Mashumba:** Favourites using localStorage, responsive layout, and CSS styling. **Both:** Accessibility, testing, debugging, documentation, and presentation.
